

WHAT IS GUARANTEED YIELD?

An Engineered Approach

Every signage project has unique specification criteria when it comes to fulfilling illumination requirements. So Relume responds with an approach that utilizes dedicated in-house lighting engineers to evaluate the variable components of signage construction, including:

- Light output goal from sign face (lux reading)
- Distance of light engine from sign face
- Material of sign face
- Thickness of sign face
- Color of sign face
- Films and graphics on sign face
- Use of diffusers
- Electrical service at jobsite
- Energy limitations/goals of project

Relume lighting engineers, not estimators, craftsmen or service technicians; determine appropriate LED quantities, layout and placement to achieve the desired signage illumination. Guesswork is eliminated and even-light distribution is guaranteed.

Added Value, No Additional Charge

To ease installation, Relume manufactures its LED Integral Circuit Boards with the following considerations upon request:

- Pre-drilled mounting holes
- Pre-drilled electrical service holes
- Panels that conform to signage support structure
- Pre-wiring to support electrical service choice of 120v, 240v or 277v
- Custom packaging to reduce on-site handling and installation time

Guaranteed Yield....

Unlike traditional reel or spool LED providers, Relume's engineered approach and value-added manufacturing process ensures the delivery of LED Integral Circuit Boards that are ready to plug-and-play within minutes. By removing the subjectivity of on-site craftsmen and service technicians, sign owners get exactly what they specify, every time. *This is guaranteed yield.*
